The primary result of mitosis and cytokinesis is the transfer of a parent cell's genome into two daughter cells. The genome is composed of a number of chromosomes—complexes of tightly coiled DNA that contain genetic information vital for proper cell function. Because each resultant daughter cell should be genetically identical to the parent cell, the parent cell must make a copy of each ...

* Bruton's tyrosine kinase . Following proliferation, small pre-B cells (no longer dividing) undergo V-J joining on one L chain chromosome. Once L chain has been successfully synthesized, it is expressed with m chain on the cell membrane and the cell is called an immature B cell. Immature B cells are very sensitive to antigen binding, so if they bind self antigen in the bone marrow they die.
