The first four axioms mean that  $V$  is an abelian group under addition.. Elements of a vector space may have various nature; for example, they can be sequences, functions, polynomials or matrices. Linear algebra is concerned with properties common to all vector spaces.

5. Solution: We have 
$$\begin{aligned} \operatorname{dim} \operatorname{null} T^* &= \\ \operatorname{dim} (\operatorname{range} T)^{\perp} &= \operatorname{dim} W \end{aligned}$$

**Chapter 7 Exercise A - Solutions to Linear Algebra Done Right**

This course covers matrix theory and linear algebra, emphasizing topics useful in other disciplines such as physics, economics and social sciences, natural sciences, and engineering. It parallels the combination of theory and applications in Professor Strang's textbook Introduction to Linear Algebra.

Linear algebra is the study of linear sets of equations and their transformation properties. Linear algebra allows the analysis of rotations in space, least squares fitting, solution of coupled differential equations, determination of a circle passing through three given points, as well as many other problems in mathematics, physics, and engineering.

In mathematics, and more specifically in linear algebra and functional analysis, the kernel (also known as null space or nullspace) of a linear map  $L : V \rightarrow W$  between two vector spaces  $V$  and  $W$ , is the set of all elements  $v$  of  $V$  for which  $L(v) = 0$ , where  $0$  denotes the zero vector in  $W$ . That is, in set-builder notation,  $\text{ker } L = \{v \in V \mid L(v) = 0\}$ .

Since the  $x$  in the second equation has a coefficient of 1, that would mean we would not have to divide by a number to solve for it and run the risk of having to work with fractions (YUCK). The easiest route here is to solve the second equation for  $x$ , and we definitely want to take the easy route.

**Schaum's Outline of Linear Algebra**

This is where we start getting into the heart of what algebra is about - solving equations. In this tutorial we will be looking specifically at linear equations and their solutions.

In this section we solve linear first order differential equations, i.e. differential equations in the form  $y' + p(t)y = g(t)$ . We give an in depth overview of the process used to solve this type of differential equation as well as a derivation of the formula needed for the integrating factor used in the solution process.

In this section we look at factoring polynomials a topic that will appear in pretty much every chapter in this course and so is vital that you understand it. We will discuss factoring out the greatest common factor, factoring by grouping, factoring quadratics and factoring polynomials with degree greater than 2.

Sanderson's short courses "tend to fall into one of two categories," he writes: topics "people might be seeking out," like many of those mentioned above, and "problems in math which many people may not have heard of, and which seem really hard at first, but where some shift in perspective makes it both doable and beautiful." These puzzles with elegantly clever solutions can be found ...
