A regular hexagon is defined as a hexagon that is both equilateral and equiangular. It is bicentric, meaning that it is both cyclic (has a circumscribed circle) and tangential (has an inscribed circle).. The common length of the sides equals the radius of the circumscribed circle or circumcircle, which equals times the apothem (radius of the inscribed circle).

In philosophy and logic, the classical liar paradox or liar's paradox or antinomy of the liar is the statement of a liar that he or she is lying: for instance, declaring that "I am lying". If the liar is indeed lying, then the liar is telling the truth, which means the liar just lied. In "this sentence is a lie" the paradox is strengthened in order to make it amenable to more rigorous logical ...

An optimal solution to a position is one that requires no more moves than is required. Since a position that required 20 moves was already known, we did not need to optimally solve every position; we just needed to find a solution of 20 moves or less for each sequence.

Rubik's Cube Notation. We use letters to describe a rotation on the cube. Learn to read the Rubik's Cube Notation and you'll be able to perform all algorithms you see in the solution tutorials. The good news is that learning only six intuitive letters is sufficient to solve the cube but if you are a speedcuber you should learn the advanced notation which you can access from this page.

A two-person game has two players. A game in which one player wins what the other player loses is called a zero-sum game. The theory of two-person zero-sum games is the foundation of more complicated games, such as games with more than two players (n-person games), and games in which the players can benefit through cooperation, with or without collusion, side payments, or binding agreements.
