Population genetics is a subfield of genetics that deals with genetic differences within and between populations, and is a part of evolutionary biology. Studies in this branch of biology examine such phenomena as adaptation, speciation, and population structure.. Population genetics was a vital ingredient in the emergence of the modern evolutionary synthesis.

Genetics is a branch of biology concerned with the study of genes, genetic variation, and heredity in organisms.. Gregor Mendel, a scientist and Augustinian friar, discovered genetics in the late 19th-century. Mendel studied "trait inheritance", patterns in the way traits are handed down from parents to offspring. He observed that organisms (pea plants) inherit traits by way of discrete "units ...

Sudarshan Chari Postdoc Sudarshan currently studies (1) the genetic architecture of complex traits using individual based whole genome sequencing (2) mechanisms of phenotypic plasticity and genetic assimilation using an 'evolve and resequence' approach and (3) the nature and degree of pleiotropy by performing meta-analysis on genome-wide association studies.

Evolution is a scientific theory used by biologists. It explains how living things change over a long time, and how they have come to be the way they are.. Earth is very old. By studying the layers of rock, we can find out about its past. That kind of research is called historical geology.. We know that living things have changed over time, because we can see their remains in the rocks.
