A thermodynamic cycle consists of a linked sequence of thermodynamic processes that involve transfer of heat and work into and out of the system, while varying pressure, temperature, and other state variables within the system, and that eventually returns the system to its initial state. In the process of passing through a cycle, the working fluid (system) may convert heat from a warm source ...

It can be concluded from Eq. that the rate of heating of the PV panel, dT_m/dt , is dependent on the following: (i) the ambient temperature. Therefore, the module temperature will be function of time between sunrise and sunset. The solar irradiance, the ambient air temperature, and the module temperature were measured between the sunrise and sunset during 1 day in June 2012.
