Examine why solving a linear system by inverting the matrix using $\text{inv}(A)*b$ is inferior to solving it directly using the backslash operator, $x = A \backslash b$. Create a random matrix A of order 500 that is constructed so that its condition number, $\text{cond}(A)$, is $1e10$, and its norm, $\text{norm}(A)$, is 1. The exact solution x is a random vector of length 500, and the right side is $b = A*x$.

Matlab release R2018b added the concept of axes-specific toolbars and default axes mouse interactivity. Plain 2D plot axes have the following default interactions enabled by default: PanInteraction, ZoomInteraction, DataTipInteraction and RulerPanInteraction. Unfortunately, I find that while the default interactions set is much more useful than the non-interactive default axes behavior in ...

Bauhaus, Art Deco, Brutalist, MATLAB, ggplot? Matlab has made a mark on the scientific visualization world. To see this you need to look no further than the ubiquity of MATLAB's former default colormap jet and the popularity of the MATLAB-inspired plotting package matplotlib in Python, the tool du jour for data scientists. However aesthetics are constantly changing.
