13.1 RNA Lesson Objectives Contrast RNA and DNA. Explain the process of transcription. Lesson Summary The Role of RNA RNA (ribonucleic acid) is a nucleic acid like DNA. It consists of a long chain of nucleotides. The RNA base sequence directs the production of proteins. Ultimately, cell proteins result in phenotypic traits.

•Messenger RNA (mRNA)-molecules are long strands of RNA nucleotides that are formed complementary to one strand of DNA. They travel from the nucleus to the ribosome to direct the synthesis of a specific protein. •Ribosomal RNA (rRNA)- is the type of RNA that associates with proteins to form ribosomes in the cytoplasm.

### **Chapter 13: DNA, RNA, and Proteins**

When proteins are needed, the corresponding genes are transcribed into RNA (transcription). The RNA is first processed so that non-coding parts are removed (processing) and is then transported out of the nucleus (transport). Outside the nucleus, the proteins are built based upon the code in the RNA (translation). BIO CH13 POWERPOINT 2015
