Frank H. Stephenson, in Calculations for Molecular Biology and Biotechnology (Third Edition), 2016
Abstract. Where bacteria or other unicellular organisms are concerned, cell growth refers to cell division and the increase in cell quantity rather than to the size of an individual cell. It is about numbers. The rate at which bacterial cells divide in culture is influenced by several factors ...

In cell biology, mitosis (/ m aɪ ' t oʊ s ɪ s /) is a part of the cell cycle when replicated chromosomes are separated into two new nuclei. Cell division gives rise to genetically identical cells in which the number of chromosomes is maintained. In general, mitosis (division of the nucleus) is preceded by the S stage of interphase (during which the DNA is replicated) and is often ...

Binary fission is a type of cell division in which a parent cell copies its genetic material, and then divides, transforming into two daughter cells, each new cell having one complete copy of the genetic instructions necessary to run the cell. The daughter cells are clones (exact copies) of the parent cell that gave rise to them.

Epidermal growth factor receptor (EGFR) is a transmembrane protein that is activated by binding of its specific ligands, including epidermal growth factor and transforming growth factor α (TGF α) ErbB2 has no known direct activating ligand, and may be in an activated state constitutively or become active upon heterodimerization with other family members such as EGFR.

Mitosis and Asexual Reproduction [back to top] Asexual reproduction is the production of offspring from a single parent using mitosis. The offspring are therefore genetically identical to each other and to their "parent"- in other words they are clones. Asexual reproduction is very common in nature, and in addition we humans have developed some new, artificial methods.

Gap 0 (G0): There are times when a cell will leave the cycle and quit dividing. This may be a temporary resting period or more permanent. An example of the latter is a cell that has reached an end stage of development and will no longer divide (e.g. neuron).

The in vitro micronucleus test is a genotoxicity test for the detection of micronuclei in the cytoplasm of interphase cells. Micronuclei may originate from acentric chromosome fragments (i.e. lacking a centromere), or whole chromosomes that are unable to migrate to the poles during the anaphase stage of cell division. The assay detects the activity of clastogenic and aneugenic test substances ...
