Remarkably, the first 6 terms (!) of the power series for this formula (with respect to e^2) coincide with the corresponding terms in the exact expansion given above. It's only with the coefficient of e^{12} that things start to differ slightly: The correct coefficient of e^{12} is $-4851/2^{20}$ whereas Ramanujan's formula gives $-9703/2^{21}$, for a discrepancy approximately equal to $-e^{12}/2^{21}$.

The perimeter of a two-dimensional shape is the total distance around the shape, or the sum of the length of its sides. By definition, a square is a four-sided shape with four straight sides of equal length, and four right (90°) angles. Since all four sides are the same length, this makes finding the perimeter of a square really easy!
