Light and Matter, an online physics textbook

Light and optics. Optics provides lots of practical opportunities for students, most of which require a limited range of simple equipment. These activities progress from an introduction to rays and images, to the more complex arrangements in optical instruments, and an introduction to colour and spectra.

Light and optics - Practical Physics

A lens is a transmissive optical device that focuses or disperses a light beam by means of refraction. A simple lens consists of a single piece of transparent material, while a compound lens consists of several simple lenses (elements), usually arranged along a common axis. Lenses are made from materials such as glass or plastic, and are ground and polished or molded to a desired shape.

No single answer to the question "What is light?" satisfies the many contexts in which light is experienced, explored, and exploited. The physicist is interested in the physical properties of light, the artist in an aesthetic appreciation of the visual world. Through the sense of sight, light is a primary tool for perceiving the world and communicating within it.

We have previously learned that visible light waves consist of a continuous range of wavelengths or frequencies. When a light wave with a single frequency strikes an object, a number of things could happen. The light wave could be absorbed by the object, in which case its energy is converted to heat.

The fiber optics I'm dealing with in this Instructable are the plastic fibers designed for lighting, not the slightly more sophisticated glass fiber bundles that transmit data rapidly over long distances, but they function on the same basic principle: Light shining in one end from a source of illumination, like an LED or a laser, travels down the fiber optic strand and emerges at the other end.
