An algorithm for finding optimal solutions for Rubik's Cube was published in 1997 by Richard Korf. While it had been known since 1995 that 20 was a lower bound on the number of moves for the solution in the worst case, it was proven in 2010 through extensive computer calculations that no configuration requires more than 20 moves. Thus 20 is a sharp upper bound on the length of optimal solutions.

A primitive root of a prime p is an integer g such that $g \pmod{p}$ has multiplicative order $p-1$ (Ribenboim 1996, p. 22). More generally, if $\text{GCD}(g,n)=1$ (g and n are relatively prime) and g is of multiplicative order $\phi(n)$ modulo n where $\phi(n)$ is the totient function, then g is a primitive root of n (Burton 1989, p. 187). The first definition is a special case of the second since $\phi(p)=p-1$ for ...

Arithmetica is the major work of Diophantus and the most prominent work on algebra in Greek mathematics. It is a collection of problems giving numerical solutions of both determinate and indeterminate equations. Of the original thirteen books of which Arithmetica consisted only six have survived, though there are some who believe that four Arabic books discovered in 1968 are also by Diophantus.

The present paper aims to analyse the translation of puns from a Relevance-Theory perspective. Relevance Theory is a cognitive-pragmatic approach to communication proposed by Sperber and Wilson in the mid-1980s (Sperber and Wilson, 1986). According to such theoretical framework, the relation between a translation and its source text is considered to be based on interpretive resemblance, rather ...

Space debris, also known as orbital debris, space junk, and space waste, is the collection of defunct objects in orbit around Earth. This includes everything from spent rocket stages, old satellites, fragments from disintegration, erosion, and collisions. Since orbits overlap with new spacecraft, debris may collide with operational spacecraft.
