This is one of a series of videos on genetics. In this video, linked genes and chromosome mapping will be discussed and demonstrated.

Linked genes and chromosome mapping

However, Mendel's Second Law is not valid for phenotypical features conditioned by genes located in the same chromosome (genes under linkage), since these genes, known as linked genes, do not separate during meiosis (except for the phenomenon of crossing over). Chromosome mapping is a technique used in autosomal DNA testing which allows the testee to determine which segments of DNA came from which ancestor. In order to map DNA segments on specific chromosomes it is necessary to test a number of close family relatives. Ideally one should test both parents, one of their children, and a number of first to third cousins on both the maternal and paternal ...

Chapter 5 Basics of Linkage and Gene mapping 46 cells. These new combinations are the result of recombination, therefore indicated as recombinants. In real life we can not observe gametes (at least, not the haplotypes), but the result from meiosis in an F1 can be checked in a testcross, which is a classical genetic test of linkage.

The white eye type is inherited in male because male has only one X chromosome which means that the male phenotype is not reflective of a dominant or recessive trait, but it reflects only the sex chromosomes that the male fly carries. This state of male genotype which has only one X chromosome is termed as hemizygous.
