Biology is subdivided into separate branches for convenience of study, though all the subdivisions are interrelated by basic principles. Thus, while it is custom to separate the study of plants from that of animals (), and the study of the structure of organisms from that of function (), all living things share in common certain biological phenomena—for example, various means of reproduction ...

Subadjacency was developed to explain why certain movement of words in sentences is allowed (e.g. What i did John claim that Peter stole t i?) while other movement is not (e.g. \*What i did John make the claim that Peter stole t i?). Similarly, Binding Principle A was devised to account for the grammaticality of sentences such as John i shaves himself i and the ungrammaticality of sentences such as ...

Self-organization, also called (in the social sciences) spontaneous order, is a process where some form of overall order arises from local interactions between parts of an initially disordered system. The process can be spontaneous when sufficient energy is available, not needing control by any external agent. It is often triggered by random fluctuations, amplified by positive feedback.

R<sub>f</sub> values are calculated by looking at the distance each component travels on the chromatography paper compared to the distance traveled by the solvent front. This ratio will be different for each component due to its unique chemical properties. When measuring the distance the component traveled, you should measure from the origin (where the middle of the spot originally was) and then to the ...

According to Sternberg, a complete explanation of intelligence entails the interaction of these three subtheories. The componential subtheory specifies the potential set of mental processes that underlies behavior (i.e., how the behavior is generated) while the contextual subtheory relates intelligence to the external world in terms of what behaviors are intelligent and where.
