An induction motor or asynchronous motor is an AC electric motor in which the electric current in the rotor needed to produce torque is obtained by electromagnetic induction from the magnetic field of the stator winding. An induction motor can therefore be made without electrical connections to the rotor. An induction motor's rotor can be either wound type or squirrel-cage type.

From high school, I remember that Aluminium has 13 electrons and thus has an unpaired electron in the 3p shell. This should make Aluminium magnetic. However, the wiki page of Aluminium says its non-

An electric motor is an electrical machine that converts electrical energy into mechanical energy. Most electric motors operate through the interaction between the motor's magnetic field and electric current in a wire winding to generate force in the form of rotation of a shaft. Electric motors can be powered by direct current (DC) sources, such as from batteries, motor vehicles or rectifiers ...

The True Induction Mini Duo Portable Counter Inset Induction Cooktop is the perfect combination of sleek design and modern technology. This unit is set apart by its ability to be inset into a countertop or being used as a countertop model to act as an extra set of burners when needed, then stored for future use.

When it comes to classifying stainless steel as having magnetic properties, there is not a simple yes and no answer. Instead, the proper response would be to state that it depends. Here is some information about stainless steel that will help to identify situations in which this alloy exhibits magnetic properties, and when it does not.

(2005-07-15) The Lorentz Force The Lorentz force on a test particle defines the electromagnetic field(s).. The expression of the Lorentz force introduced here defines dynamically the fields which are governed by Maxwell's equations, as presented further down. Neither of these two statements is a logical consequence of the other.

Induction stovetops cook food by using electromagnets to heat the pots instead of applying heat to pots. Induction cooktops are highly energy-efficient, as no heat is lost between the cooking surface and the pot, providing fast response time and temperature control.

The source of the changing magnetic fields in MRI may either be the imaging gradients or radiofrequency (RF) coils. The conductive material in which eddy currents are induced may be any metallic component of the MR scanner (other coils, shields, tubes, and housing), wires or devices within or on the patient, and the patient as a whole (in the final analysis, people are just big bags of saline!)
