G<sub>1</sub> checkpoint. -The primary checkpoint of the cell cycle is the G<sub>1</sub> checkpoint. -DNA damage stops the cycle at the G<sub>1</sub> checkpoint by the protein p53; if the DNA is not repaired, p53 triggers apoptosis. -Another protein, RB (retinoblastoma), is responsible for interpreting growth and nutrient availability signals.

Cell Cycle. The cell cycle involves many repetitions of cellular growth and reproduction. With few exceptions (for example, red blood cells), all the cells of living things undergo a cell cycle. The cell cycle is generally divided into two phases: interphase and mitosis.

Phases of the Cell Cycle. As part of that process, we need to make duplicate copies of our chromosomes. Basically the, point of replication in S phase, that event in the cell cycle, is to make duplicate chromosomes. As the cell is making copies of the chromosomes, it's synthesizing what are called chromatids.

The cell cycle or cell-division cycle is the series of events that take place in a cell leading to its division and duplication of its DNA (DNA replication) to produce two daughter cells. In bacteria, which lack a cell nucleus, the cell cycle is divided into the B, C, and D periods.

BIOLOGY I. Chapter 12 - The Cell Cycle Basic Terms Chromosome The cellular threadlike structure that contains the genetic material of cells (in the nucleus of an eukaryotic cell, or the nucleoid region of prokaryotic cells). Each chromosome consists of one very long DNA molecule and associated proteins.

### Chapter 12: THE CELL CYCLE AND CELLULAR REPRODUCTION

It's usually abbreviated, "G1." As you can see here, G1 is the longest phase of the cell cycle, so most of a cell's life is spent here, and it's in this phase that we produce extra organelles, such as ribosomes and proteins. So we make proteins that will be useful when we get to the point of cell division. >From here, the cell has a choice.
