Can someone explain why taking an average of an average usually results in a wrong answer? Is there ever a case where the average of the average can be used correctly? As an example, let's say ...

Why is an average of an average usually incorrect ...

This is in fact one of the most common and useful ways to use an interface. The interface defines a contract, and your code can work with any class that implements the interface, without having to know the concrete class - it can even work with classes that didn't exist yet when the code was written.

If you think whiptail is complex, here it goes a bash-only code that does exactly what you want. It's short (~20 lines), but a bit cryptic for a beginner. Besides showing "+" for checked options, it also provides feedback for each user action ("invalid option", "option X was checked"/unchecked, etc).
