Categorical Data Analysis Agresti Complete

In probability theory and statistics, a categorical distribution (also called a generalized Bernoulli distribution, multinoulli distribution) is a discrete probability distribution that describes the possible results of a random variable that can take on one of K possible categories, with the probability of each category separately specified. There is no innate underlying ordering of these ...

Statistics is a branch of mathematics working with data collection, organization, analysis, interpretation and presentation. In applying statistics to, for example, a scientific, industrial, or social problem, it is conventional to begin with a statistical population or a statistical model process to be studied. Populations can be diverse topics such as "all people living in a country" or ...

How does LCA work? LCA supposes a simple parametric model and uses observed data to estimate parameter values for the model. The model parameters are: (1) the prevalence of each of C case subpopulations or latent classes (they are called 'latent' because a case's class membership is not directly observed); and (2) conditional response probabilities--i.e., the probabilities, for each ...

To enhance patient safety, data about actual clinical events must be collected and scrutinized. This paper has two purposes. First, it provides an overview of some of the methods available to collect and analyze retrospective data about medical errors, near misses, and other relevant patient safety events. Second, it introduces a methodological approach that focuses on non-routine events (NRE ...

There are numerous ways to describe and present the variation that is inherent to most data sets. Range (defined as the largest value minus the smallest) is one common measure and has the advantage of being simple and intuitive. Range, however, can be misleading because of the presence of outliers, and it tends to be larger for larger sample sizes even without unusual data values.

The dataset on which we originally trained our model contained seven binomial expressions that were also included in Siyanova-Chanturia et al.'s (2011) items, which we later use as test items. Therefore, after doing model selection on the original dataset, we retrained our model, excluding these seven items from the training data.

This book builds theoretical statistics from the first principles of probability theory. Starting from the basics of probability, the authors develop the theory of statistical inference using techniques, definitions, and concepts that are statistical and are natural extensions and consequences of previous concepts.
