Solving Linear Programming Problems. Now, we have all the steps that we need for solving linear programming problems, which are: Step 1: Interpret the given situations or constraints into inequalities. Step 2: Plot the inequalities graphically and identify the feasible region. Step 3: Determine the gradient for the line representing the solution (the linear objective function).

Not all linear programming problems are so easily solved. There may be many vari-ables and many constraints. Some variables may be constrained to be nonnegative and others unconstrained. Some of the main constraints may be equalities and others inequal-ities. However, two classes of problems, called here thestandard maximum problem and

Linear programming or linear optimization is a process which takes into consideration certain linear relationships to obtain the best possible solution to a mathematical model. It includes problems dealing with maximizing profits, minimizing costs, minimal usage of resources, etc. These problems are known as the linear programming problems (LPP).

9.3 THE SIMPLEX METHOD: MAXIMIZATION For linear programming problems involving two variables, the graphical solution method introduced in Section 9.2 is convenient. However, for problems involving more than two variables or problems involving a large number of constraints, it is better to use solution methods that are adaptable to computers.

A problem with this structure is said to be in canonical form. This formulation might appear to be quite limited and restrictive; as we will see later, however, any linear programming problem can be transformed so that it is in canonical form. Thus, the following discussion is valid for linear programs in general.

However, some problems have distinct optimal solutions; for example, the problem of finding a

feasible solution to a system of linear inequalities is a linear programming problem in which the objective function is the zero function (that is, the constant function taking the value zero everywhere).

To solve a linear programming problem, we first need to know the Fundamental Theorem of Linear Programming: • Given that an optimal solution to a linear programming problem exists, it must occur at a vertex of the feasible set. • If the optimal solution occurs at two adjacent vertices of the feasible set, then the linear programming problem ...

Optimal Solution of a Linear Programming Problem If a linear programming problem has a solution, it must occur at a vertex of the set of feasible solutions. If the problem has more than one solution, then at least one of them must occur at a vertex of the set of feasible solutions. In either case, the value of the objective function is unique.
