Linear System Theory Solution

For a given system of linear equations, there are only three possibilities for the solution set of the system: No solution (inconsistent), a unique solution, or infinitely many solutions. The possibilities for the solution set of a homogeneous system is either a unique solution or infinitely many solutions.

Then a standard result in the theory of differential equations is that a solution x(t. at least for |a-a(. time-varying linear state equations provide descriptions of the parameter sensitivity of solutions of nonlinear state equations.) As an example, many linear systems theory books "cheat" when presenting the solution of linear time invariant system: they assume that the structure of the solution is already known, e.g. that the solution is of the form x(t) = exp(At)*z(t) where z(t) is then shown to have the desired form.

A solution of a linear system is an assignment of values to the variables x1, x2, ..., xn such that each of the equations is satisfied. The set of all possible solutions is called the solution set. A linear system may behave in any one of three possible ways: The system has infinitely many solutions.

This course provides an introduction to the modern state space theory of linear systems for

students of circuits, communications, controls, and signal processing. In some sense it is a second course in linear systems, since it builds on an understanding that students have seen linear systems in use in at least some context before.
